BACKGROUND OF THE INVENTION

[0004] Diabetes mellitus, commonly called diabetes, refers to a disease process derived
from multiple causative factors and characterized by elevated levels of plasma glucose,
referred to as hyperglycemia. *See, e.g.,* LeRoith, D. *et al.*, (eds.), DIABETES MELLITUS
(Lippincott-Raven Publishers, Philadelphia, PA U.S.A. 1996), and all references cited
20 therein. According to the American Diabetes Association, diabetes mellitus is estimated to
affect approximately 6% of the world population. Uncontrolled hyperglycemia is associated
with increased and premature mortality due to an increased risk for microvascular and
macrovascular diseases, including nephropathy, neuropathy, retinopathy, hypertension,
cerebrovascular disease and coronary heart disease. Therefore, control of glucose
25 homeostasis is a critically important approach for the treatment of diabetes.

[0005] There are two major forms of diabetes: Type 1 diabetes (formerly referred to as
insulin-dependent diabetes or IDDM); and Type 2 diabetes (formerly referred to as non-
insulin dependent diabetes or NIDDM).

[0006] Type 1 diabetes is the result of an absolute deficiency of insulin, the hormone which
30 regulates glucose utilization. This insulin deficiency is usually characterized by β -cell
destruction within the Islets of Langerhans in the pancreas, which usually leads to absolute
insulin deficiency. Type 1 diabetes has two forms: Immune-Mediated Diabetes Mellitus,
which results from a cellular mediated autoimmune destruction of the β cells of the pancreas;

and Idiopathic Diabetes Mellitus, which refers to forms of the disease that have no known etiologies.

[0007] Type 2 diabetes is a disease characterized by insulin resistance accompanied by relative, rather than absolute, insulin deficiency. Type 2 diabetes can range from

5 predominant insulin resistance with relative insulin deficiency to predominant insulin deficiency with some insulin resistance. Insulin resistance is the diminished ability of insulin to exert its biological action across a broad range of concentrations. In insulin resistant individuals, the body secretes abnormally high amounts of insulin to compensate for this defect. When inadequate amounts of insulin are present to compensate for insulin resistance and adequately control glucose, a state of impaired glucose tolerance develops. In a
10 significant number of individuals, insulin secretion declines further and the plasma glucose level rises, resulting in the clinical state of diabetes. Type 2 diabetes can be due to a profound resistance to insulin stimulating regulatory effects on glucose and lipid metabolism in the main insulin-sensitive tissues: muscle, liver and adipose tissue. This resistance to
15 insulin responsiveness results in insufficient insulin activation of glucose uptake, oxidation and storage in muscle and inadequate insulin repression of lipolysis in adipose tissue and of glucose production and secretion in liver. In Type 2 diabetes, free fatty acid levels are often elevated in obese and some non-obese patients and lipid oxidation is increased.

[0008] Premature development of atherosclerosis and increased rate of cardiovascular and
20 peripheral vascular diseases are characteristic features of patients with diabetes, with hyperlipidemia being an important precipitating factor for these diseases.

[0009] Hyperlipidemia is a condition generally characterized by an abnormal increase in serum lipids in the bloodstream and, as noted above, is an important risk factor in developing atherosclerosis and heart disease. For a review of disorders of lipid metabolism, *see, e.g.,*

25 Wilson, J. *et al.*, (ed.), *Disorders of Lipid Metabolism*, Chapter 23, Textbook of Endocrinology, 9th Edition, (W.B. Sanders Company, Philadelphia, PA U.S.A. 1998; this reference and all references cited therein are herein incorporated by reference). Serum lipoproteins are the carriers for lipids in the circulation. They are classified according to their density: chylomicrons; very low-density lipoproteins (VLDL); intermediate density
30 lipoproteins (IDL); low density lipoproteins (LDL); and high density lipoproteins (HDL). Hyperlipidemia is usually classified as primary or secondary hyperlipidemia. Primary hyperlipidemia is generally caused by genetic defects, while secondary hyperlipidemia is generally caused by other factors, such as various disease states, drugs, and dietary factors. Alternatively, hyperlipidemia can result from both a combination of primary and secondary

[0010] Dyslipidemia, or abnormal levels of lipoproteins in blood plasma, is a frequent occurrence among diabetics, and has been shown to be one of the main contributors to the increased incidence of coronary events and deaths among diabetic subjects (*see, e.g.,* Joslin, E. *Ann. Chim. Med.* (1927) 5: 1061-1079). Epidemiological studies since then have confirmed the association and have shown a several-fold increase in coronary deaths among diabetic subjects when compared with nondiabetic subjects (*see, e.g.,* Garcia, M. J. *et al., Diabetes* (1974) 23: 105-11 (1974); and Laakso, M. and Lehto, S., *Diabetes Reviews* (1997) 5(4): 294-315). Several lipoprotein abnormalities have been described among diabetic subjects (Howard B., *et al., Artherosclerosis* (1978) 30: 153-162).

[0048] As used herein, the term "carboxylic acid surrogate" refers to those moieties that are used as surrogates for a carboxylic acid moiety. Such groups are generally known to one of skill in the art (see, for example, THE PRACTICE OF MEDICINAL CHEMISTRY; Wermuth, C.G.,

ed., Academic Press, New York, 1996, page 203). Suitable isosteres or surrogates include -C(O)NHSO₂R wherein R can be alkyl, haloalkyl, heteroalkyl, aralkyl, aryl, heteroaryl, heterocyclyl, alkoxy, haloalkoxy, aryloxy, alkylamino, haloalkylamino, dialkylamino, dihaloalkylamino, arylamino, diarylamino, arakylamino, diarakylamino or other groups to provide an overall acidic character to the moiety; sulfonic acids; sulfinic acids; phosphonic acids; phosphinic acids; activated sulfonamides (e.g., -SO₂NHX wherein X is an electron withdrawing group relative to an alkyl group, such as an acyl group or aryl group; activated carboxamides (e.g., -C(O)NHCN); hydroxamic acids (-C(O)NHOH); acidic heterocycles or substituted heterocycles (e.g., tetrazoles, triazoles, hydroxypyrazoles, hydroxyoxazoles, hydroxythiadiazoles); and acidic alcohols (e.g., -C(CF₃)₂OH or -CH(CF₃)OH).

[0049] Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed "isomers". Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers". Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other are termed "enantiomers". When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the *R*- and *S*-sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (*i.e.*, as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a "racemic mixture".

[0050] The compounds of this invention may exist in stereoisomeric form if they possess one or more asymmetric centers or a double bond with asymmetric substitution and, therefore, can be produced as individual stereoisomers or as mixtures. Unless otherwise indicated, the description is intended to include individual stereoisomers as well as mixtures. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art (see discussion in Chapter 4 of ADVANCED ORGANIC CHEMISTRY, 4th edition J. March, John Wiley and Sons, New York, 1992).

[0051] "Pharmaceutically acceptable salt" of a compound means a salt that is pharmaceutically acceptable and that possesses the desired pharmacological activity of the parent compound. Such salts include:

[0052] (1) acid addition salts, formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like; or formed with organic acids such as acetic acid, propionic acid, hexanoic acid, cyclopentanepropionic acid, glycolic acid, pyruvic acid, lactic acid, malonic acid, succinic acid, malic acid, maleic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, 3-(4-hydroxybenzoyl)benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, 1,2-ethane-disulfonic acid, 2-hydroxyethanesulfonic acid, benzenesulfonic acid, 4-chlorobenzenesulfonic acid, 2-naphthalenesulfonic acid, 4-toluenesulfonic acid, camphorsulfonic acid, 4-methylbicyclo[2.2.2]-oct-2-ene-1-carboxylic acid, glucoheptonic acid, 3-phenylpropionic acid, trimethylacetic acid, tertiary butylacetic acid, lauryl sulfuric acid, gluconic acid, glutamic acid, hydroxynaphthoic acid, salicylic acid, stearic acid, muconic acid, and the like; or

[0053] (2) salts formed when an acidic proton present in the parent compound either is replaced by a metal ion, *e.g.*, an alkali metal ion, an alkaline earth ion, or an aluminum ion; or coordinates with an organic base such as ethanolamine, diethanolamine, triethanolamine, trimethylamine, *N*-methylglucamine, and the like.

[0054] "Prodrugs" means any compound which releases an active parent drug according to Formula Ia or Ib *in vivo* when such prodrug is administered to a mammalian subject.

Prodrugs of a compound of Formula Ia or Ib are prepared by modifying functional groups present in the compound of Formula Ia or Ib in such a way that the modifications may be cleaved *in vivo* to release the parent compound. Prodrugs include compounds of Formula Ia or Ib wherein a hydroxy, amino, or sulfhydryl group in a compound of Formula Ia or Ib is bonded to any group that may be cleaved *in vivo* to regenerate the free hydroxyl, amino, or sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to esters (*e.g.*, acetate, formate, and benzoate derivatives), amides, carbamates (*e.g.*, *N,N*-dimethylaminocarbonyl) of hydroxy functional groups in compounds of Formula Ia or Ib, and the like.

[0055] "Protecting group" refers to a grouping of atoms that when attached to a reactive group in a molecule masks, reduces or prevents that reactivity. Examples of protecting groups can be found in T.W. Greene and P.G. Wuts, PROTECTIVE GROUPS IN ORGANIC CHEMISTRY, (Wiley, 2nd ed. 1991) and Harrison and Harrison *et al.*, COMPENDIUM OF SYNTHETIC ORGANIC METHODS, Vols. 1-8 (John Wiley and Sons. 1971-1996).

Representative amino protecting groups include formyl, acetyl, trifluoroacetyl, benzyl, benzyloxycarbonyl (CBZ), *tert*-butoxycarbonyl (Boc), trimethyl silyl (TMS), 2-

trimethylsilyl-ethanesulfonyl (SES), trityl and substituted trityl groups, allyloxycarbonyl, 9-fluorenylmethyloxycarbonyl (FMOC), nitro-veratryloxycarbonyl (NVOC) and the like.

Representative hydroxy protecting groups include those where the hydroxy group is either acylated or alkylated such as benzyl and trityl ethers as well as alkyl ethers,

5 tetrahydropyranyl ethers, trialkylsilyl ethers and allyl ethers.

[0056] Turning next to the compositions of the invention, the term "pharmaceutically acceptable carrier or excipient" means a carrier or excipient that is useful in preparing a pharmaceutical composition that is generally safe, non-toxic and neither biologically nor otherwise undesirable, and includes a carrier or excipient that is acceptable for veterinary use
10 as well as human pharmaceutical use. A "pharmaceutically acceptable carrier or excipient" as used in the specification and claims includes both one and more than one such carrier or excipient.

[0057] With reference to the methods of the present invention, the following terms are used with the noted meanings:

15 [0058] The terms "treating" or "treatment" of a disease includes:

[0059] (1) preventing the disease, *i.e.*, causing the clinical symptoms of the disease not to develop in a mammal that may be exposed to or predisposed to the disease but does not yet experience or display symptoms of the disease,

[0060] (2) inhibiting the disease, *i.e.*, arresting or reducing the development of the
20 disease or its clinical symptoms, or

[0061] (3) relieving the disease, *i.e.*, causing regression of the disease or its clinical symptoms.

[0062] The term "therapeutically effective amount" means the amount of the subject compound that will elicit the biological or medical response of a tissue, system, animal or
25 human that is being sought by the researcher, veterinarian, medical doctor or other clinician. "A therapeutically effective amount" includes the amount of a compound that, when administered to a mammal for treating a disease, is sufficient to effect such treatment for the disease. The "therapeutically effective amount" will vary depending on the compound, the disease and its severity and the age, weight, *etc.*, of the mammal to be treated.

30 [0063] The term "mammal" includes, without limitation, humans, domestic animals (*e.g.*, dogs or cats), farm animals (cows, horses, or pigs), monkeys, rabbits, mice, and laboratory animals.

[0064] The term "insulin resistance" can be defined generally as a disorder of glucose metabolism. More specifically, insulin resistance can be defined as the diminished ability of

insulin to exert its biological action across a broad range of concentrations producing less than the expected biologic effect. (see, e.g., Reaven, G. M., *J. Basic & Clin. Phys. & Pharm.* (1998) 9: 387-406 and Flier, J. *Ann Rev. Med.* (1983) 34: 145-60). Insulin resistant persons have a diminished ability to properly metabolize glucose and respond poorly, if at all, to insulin therapy. Manifestations of insulin resistance include insufficient insulin activation of glucose uptake, oxidation and storage in muscle and inadequate insulin repression of lipolysis in adipose tissue and of glucose production and secretion in liver. Insulin resistance can cause or contribute to polycystic ovarian syndrome, Impaired Glucose Tolerance (IGT), gestational diabetes, hypertension, obesity, atherosclerosis and a variety of other disorders. Eventually, the insulin resistant individuals can progress to a point where a diabetic state is reached. The association of insulin resistance with glucose intolerance, an increase in plasma triglyceride and a decrease in high-density lipoprotein cholesterol concentrations, high blood pressure, hyperuricemia, smaller denser low-density lipoprotein particles, and higher circulating levels of plasminogen activator inhibitor-1), has been referred to as "Syndrome X" (see, e.g., Reaven, G. M., *Physiol. Rev.* (1995) 75: 473-486).

[0065] The term "diabetes mellitus" or "diabetes" means a disease or condition that is generally characterized by metabolic defects in production and utilization of glucose which result in the failure to maintain appropriate blood sugar levels in the body. The result of these defects is elevated blood glucose, referred to as "hyperglycemia." Two major forms of diabetes are Type 1 diabetes and Type 2 diabetes. As described above, Type 1 diabetes is generally the result of an absolute deficiency of insulin, the hormone which regulates glucose utilization. Type 2 diabetes often occurs in the face of normal, or even elevated levels of insulin and can result from the inability of tissues to respond appropriately to insulin. Most Type 2 diabetic patients are insulin resistant and have a relative deficiency of insulin, in that insulin secretion can not compensate for the resistance of peripheral tissues to respond to insulin. In addition, many Type 2 diabetics are obese. Other types of disorders of glucose homeostasis include Impaired Glucose Tolerance, which is a metabolic stage intermediate between normal glucose homeostasis and diabetes, and Gestational Diabetes Mellitus, which is glucose intolerance in pregnancy in women with no previous history of Type 1 or Type 2 diabetes.

[0066] The term "secondary diabetes" is diabetes resulting from other identifiable etiologies which include: genetic defects of β cell function (e.g., maturity onset-type diabetes of youth, referred to as "MODY," which is an early-onset form of Type 2 diabetes with autosomal inheritance; see, e.g., Fajans S. *et al.*, *Diabet. Med.* (1996) (9 Suppl 6): S90-5 and

Bell, G. *et al.*, *Annu. Rev. Physiol.* (1996) 58: 171-86; genetic defects in insulin action; diseases of the exocrine pancreas (*e.g.*, hemochromatosis, pancreatitis, and cystic fibrosis); certain endocrine diseases in which excess hormones interfere with insulin action (*e.g.*, growth hormone in acromegaly and cortisol in Cushing's syndrome); certain drugs that suppress insulin secretion (*e.g.*, phenytoin) or inhibit insulin action (*e.g.*, estrogens and glucocorticoids); and diabetes caused by infection (*e.g.*, rubella, Coxsackie, and CMV); as well as other genetic syndromes.

[0067] The guidelines for diagnosis for Type 2 diabetes, impaired glucose tolerance, and gestational diabetes have been outlined by the American Diabetes Association (*see, e.g.*, The Expert Committee on the Diagnosis and Classification of Diabetes Mellitus, *Diabetes Care*, (1999) Vol 2 (Suppl 1): S5-19).

[0068] The term "hyperinsulinemia" refers to the presence of an abnormally elevated level of insulin in the blood. Similarly, the term "hyperuricemia" refers to the presence of an abnormally elevated level of uric acid in the blood. The term "hyperlipidemia" refers to the presence of an abnormally elevated level of lipids in the blood. Hyperlipidemia can appear in at least three forms: (1) hypercholesterolemia, *i.e.*, an elevated cholesterol level; (2) hypertriglyceridemia, *i.e.*, an elevated triglyceride level; and (3) combined hyperlipidemia, *i.e.*, a combination of hypercholesterolemia and hypertriglyceridemia.

[0069] The term "secretagogue" means a substance or compound that stimulates secretion. For example, an insulin secretagogue is a substance or compound that stimulates secretion of insulin.

[0070] The term "hemoglobin" or "Hb" refers to a respiratory pigment present in erythrocytes, which is largely responsible for oxygen transport. A hemoglobin molecule comprises four polypeptide subunits (two α chain systems and two β chain systems, respectively). Each subunit is formed by association of one globin protein and one heme molecule which is an iron-protoporphyrin complex. The major class of hemoglobin found in normal adult hemolysate is adult hemoglobin (referred to as "HbA"; also referred to HbA₀ for distinguishing it from glycated hemoglobin, which is referred to as "HbA₁," described *infra*) having $\alpha_2\beta_2$ subunits. Trace components such as HbA₂ ($\alpha_2\delta_2$) can also be found in normal adult hemolysate.

[0071] Among classes of adult hemoglobin HbAs, there is a glycated hemoglobin (referred to as "HbA₁," or "glycosylated hemoglobin"), which may be further fractionated into HbA_{1a1}, HbA_{1a2}, HbA_{1b}, and HbA_{1c} with an ion exchange resin fractionation. All of these subclasses have the same primary structure, which is stabilized by formation of an aldimine (Schiff

base) by the amino group of N-terminal valine in the β subunit chain of normal hemoglobin HbA and glucose (or, glucose-6-phosphate or fructose) followed by formation of ketoamine by Amadori rearrangement.

[0072] The term “glycosylated hemoglobin” (also referred to as “HbA_{1c},” “GHb”,

5 “hemoglobin - glycosylated”, “diabetic control index” and “glycohemoglobin”; hereinafter referred to as “hemoglobin A_{1c}”) refers to a stable product of the nonenzymatic glycosylation of the β -chain of hemoglobin by plasma glucose. Hemoglobin A_{1c} comprises the main portion of glycated hemoglobins in the blood. The ratio of glycosylated hemoglobin is proportional to blood glucose level. Therefore, hemoglobin A_{1c} rate of formation directly increases with
10 increasing plasma glucose levels. Since glycosylation occurs at a constant rate during the 120-day lifespan of an erythrocyte, measurement of glycosylated hemoglobin levels reflect the average blood glucose level for an individual during the preceding two to three months. Therefore determination of the amount of glycosylated hemoglobin HbA_{1c} can be a good index for carbohydrate metabolism control. Accordingly, blood glucose levels of the last two
15 months can be estimated on the basis of the ratio of HbA_{1c} to total hemoglobin Hb. The analysis of the hemoglobin A_{1c} in blood is used as a measurement enabling long-term control of blood glucose level (*see, e.g., Jain, S., et al., Diabetes (1989) 38: 1539-1543; Peters A., et al., JAMA (1996) 276: 1246-1252*).

[0073] The term “symptom” of diabetes, includes, but is not limited to, polyuria,
20 polydipsia, and polyphagia, as used herein, incorporating their common usage. For example, “polyuria” means the passage of a large volume of urine during a given period; “polydipsia” means chronic, excessive thirst; and “polyphagia” means excessive eating. Other symptoms of diabetes include, *e.g.,* increased susceptibility to certain infections (especially fungal and staphylococcal infections), nausea, and ketoacidosis (enhanced production of ketone bodies
25 in the blood).

[0074] The term “complication” of diabetes includes, but is not limited to, microvascular complications and macrovascular complications. Microvascular complications are those complications which generally result in small blood vessel damage. These complications include, *e.g.,* retinopathy (the impairment or loss of vision due to blood vessel damage in the
30 eyes); neuropathy (nerve damage and foot problems due to blood vessel damage to the nervous system); and nephropathy (kidney disease due to blood vessel damage in the kidneys). Macrovascular complications are those complications which generally result from large blood vessel damage. These complications include, *e.g.,* cardiovascular disease and peripheral vascular disease. Cardiovascular disease refers to diseases of blood vessels of the

heart. *See. e.g., Kaplan, R. M., et al., "Cardiovascular diseases" in HEALTH AND HUMAN BEHAVIOR, pp. 206-242 (McGraw-Hill, New York 1993).* Cardiovascular disease is generally one of several forms, including, *e.g.,* hypertension (also referred to as high blood pressure), coronary heart disease, stroke, and rheumatic heart disease. Peripheral vascular disease refers to diseases of any of the blood vessels outside of the heart. It is often a narrowing of the blood vessels that carry blood to leg and arm muscles.

[0075] The term "atherosclerosis" encompasses vascular diseases and conditions that are recognized and understood by physicians practicing in the relevant fields of medicine.

Atherosclerotic cardiovascular disease, coronary heart disease (also known as coronary artery disease or ischemic heart disease), cerebrovascular disease and peripheral vessel disease are all clinical manifestations of atherosclerosis and are therefore encompassed by the terms "atherosclerosis" and "atherosclerotic disease".

[0076] The term "antihyperlipidemic" refers to the lowering of excessive lipid concentrations in blood to desired levels. Similarly, the term "antiuricemic" refers to the lowering of excessive uric acid concentrations in blood to desired levels.

[0077] The term "modulate" refers to the treating, prevention, suppression, enhancement or induction of a function or condition. For example, the compounds of the present invention can modulate hyperlipidemia by lowering cholesterol in a human, thereby suppressing hyperlipidemia.

[0078] The term "triglyceride(s)" ("TGs"), as used herein, incorporates its common usage. TGs consist of three fatty acid molecules esterified to a glycerol molecule and serve to store fatty acids which are used by muscle cells for energy production or are taken up and stored in adipose tissue.

[0079] Because cholesterol and TGs are water insoluble, they must be packaged in special molecular complexes known as "lipoproteins" in order to be transported in the plasma. Lipoproteins can accumulate in the plasma due to overproduction and/or deficient removal. There are at least five distinct lipoproteins differing in size, composition, density, and function. In the cells of the small of the intestine, dietary lipids are packaged into large lipoprotein complexes called "chylomicrons", which have a high TG and low-cholesterol content. In the liver, TG and cholesterol esters are packaged and released into plasma as TG-rich lipoprotein called very low density lipoprotein ("VLDL"), whose primary function is the endogenous transport of TGs made in the liver or released by adipose tissue. Through enzymatic action, VLDL can be either reduced and taken up by the liver, or transformed into intermediate density lipoprotein ("IDL"). IDL, is in turn, either taken up by the liver, or is

further modified to form the low density lipoprotein ("LDL"). LDL is either taken up and broken down by the liver, or is taken up by extrahepatic tissue. High density lipoprotein ("HDL") helps remove cholesterol from peripheral tissues in a process called reverse cholesterol transport.

5 [0080] The term "dyslipidemia" refers to abnormal levels of lipoproteins in blood plasma including both depressed and/or elevated levels of lipoproteins (*e.g.*, elevated levels of LDL, VLDL and depressed levels of HDL).

[0081] Exemplary Primary Hyperlipidemia include, but are not limited to, the following:

10 [0082] (1) *Familial Hyperchylomicronemia*, a rare genetic disorder which causes a deficiency in an enzyme, LP lipase, that breaks down fat molecules. The LP lipase deficiency can cause the accumulation of large quantities of fat or lipoproteins in the blood;

[0083] (2) *Familial Hypercholesterolemia*, a relatively common genetic disorder caused where the underlying defect is a series of mutations in the LDL receptor gene that result in malfunctioning LDL receptors and/or absence of the LDL receptors. This brings about
15 ineffective clearance of LDL by the LDL receptors resulting in elevated LDL and total cholesterol levels in the plasma;

[0084] (3) *Familial Combined Hyperlipidemia*, also known as multiple lipoprotein-type hyperlipidemia; an inherited disorder where patients and their affected first-degree relatives can at various times manifest high cholesterol and high triglycerides. Levels of HDL
20 cholesterol are often moderately decreased;

[0085] (4) *Familial Defective Apolipoprotein B-100* is a relatively common autosomal dominant genetic abnormality. The defect is caused by a single nucleotide mutation that produces a substitution of glutamine for arginine which can cause reduced affinity of LDL particles for the LDL receptor. Consequently, this can cause high plasma LDL and total
25 cholesterol levels;

[0086] (5) *Familial Dysbetalipoproteinemia*, also referred to as Type III Hyperlipoproteinemia, is an uncommon inherited disorder resulting in moderate to severe elevations of serum TG and cholesterol levels with abnormal apolipoprotein E function. HDL levels are usually normal; and

30 [0087] (6) *Familial Hypertriglyceridemia*, is a common inherited disorder in which the concentration of plasma VLDL is elevated. This can cause mild to moderately elevated triglyceride levels (and usually not cholesterol levels) and can often be associated with low plasma HDL levels.

[0088] Risk factors in exemplary Secondary Hyperlipidemia include, but are not limited to, the following: (1) disease risk factors, such as a history of Type 1 diabetes, Type 2 diabetes, Cushing's syndrome, hypothyroidism and certain types of renal failure; (2) drug risk factors, which include, birth control pills; hormones, such as estrogen, and corticosteroids; certain diuretics; and various β blockers; (3) dietary risk factors include dietary fat intake per total calories greater than 40%; saturated fat intake per total calories greater than 10%; cholesterol intake greater than 300 mg per day; habitual and excessive alcohol use; and obesity.

[0089] The terms "obese" and "obesity" refers to, according to the World Health Organization, a Body Mass Index (BMI) greater than 27.8 kg/m^2 for men and 27.3 kg/m^2 for women (BMI equals weight (kg)/height (m^2)). Obesity is linked to a variety of medical conditions including diabetes and hyperlipidemia. Obesity is also a known risk factor for the development of Type 2 diabetes (See, e.g., Barrett-Conner, E., *Epidemol. Rev.* (1989) 11: 172-181; and Knowler, et al., *Am. J. Clin. Nutr.* (1991) 53:1543-1551).

[0090] The terms "optional" or "optionally" as used throughout the specification means that the subsequently described event or circumstance may but need not occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not. For example, "heterocyclo group optionally mono- or di- substituted with an alkyl group" means that the alkyl may but need not be present, and the description includes situations where the heterocyclo group is mono- or disubstituted with an alkyl group and situations where the heterocyclo group is not substituted with the alkyl group.

General

[0091] The present invention derives from the discovery that compounds of Formula Ia or Ib are useful in treating or controlling a number of diseases associated with glucose metabolism, lipid metabolism and insulin secretion. More particularly, the compounds of the invention are useful in treating insulin resistance, diabetes, hyperinsulinemia, hyperlipidemia, hyperuricemia and obesity. Without intending to be bound by theory, it is considered that the compounds of Formula Ia or Ib operate via modulation of receptor interactions associated with one or more isoforms of PPAR. As a result, the compounds will likely have utility in treating other diseases states or conditions associated with PPAR.

General Synthetic Routes to Compounds of the Invention

[0116] The compounds of the present invention can be prepared using methods generally outlined in Schemes 1-5.

5

Scheme 1

[0117] According to Scheme 1, salicylic acids of formula i (either commercially available or prepared according to known methods) are condensed with suitably substituted 2-aminophenols (ii) to provide a 2-(benzoxazol-2-yl)phenol (iii). Treatment of iii with a suitably substituted ethyl 2-bromophenylacetate (vi-a), generally in the presence of a base such as potassium carbonate, provides the target compound vii. Alternatively, 2-fluorobenzoic acids (iv) can be converted to the corresponding derivatives v which can then be converted to iii and carried on through the scheme as noted, or, in certain embodiments, compounds of formula v can be converted directly into target compounds vii using 2-hydroxyphenylacetic acid derivatives (vi-b). The latter route is particularly useful for the compounds of formula vii in which R¹ substituents increase the reactivity of the ring toward fluorine displacement. Additionally, in the above Scheme as well as in Formulae II and III, below, each R⁴ (the subscript s being an integer of from 0 to 4), is meant to include any of the HAr substituents provided above.

[0118] Structural isomers, having the benzoxazolyl ring attached at either the 3-position or the 4-position relative to the phenolic hydroxy group in compound **iii** can be prepared from the corresponding 3-hydroxybenzoic acids and 4-hydroxybenzoic acids.

[0119] In a similar manner, compounds of formula Ia wherein X is NH can be prepared as follows.

Scheme 2

[0120] Here, a 2-fluorobenzoic acid or benzoyl chloride (**viii**) serves as the starting material. The acid chloride is treated with 2-aminophenols (**ii**) to provide substituted aryl fluorides, **ix**. Treatment of **ix** with the suitably substituted ethyl 2-aminophenylacetate (**vi-c**) provides the target compound **x**.

[0121] Still further, the general schemes outlined in Scheme 1 and Scheme 2 can be used to prepare compounds of Formula Ia in which HAr is benzothiazolyl. To obtain these compounds, the 2-aminophenols (**ii**) are replaced by the corresponding 2-aminothiophenols. More specific details are provided in the examples below.

[0122] Preparation of compounds of Formula Ia in which HAr is a suitably substituted benzimidazole can be prepared according to the general methods outlined in Scheme 3.

Scheme 3

[0123] In Scheme 3, salicylic acid derivatives of formula **i** are condensed with N-methyl-1,2-phenylenediamine derivatives (**xi**) to provide benzimidazolyl-substituted phenols of formula **xii**. Conversion of **xii** to the desired products (**xiii**) can be accomplished using suitably substituted ethyl 2-bromophenylacetate (**vi-a**, in Scheme 1). Additionally, while the synthetic route is illustrated for the preparation of N-methyl benzimidazole compounds, the invention is not so limited and derivatives are contemplated wherein the N-methyl is replaced by hydrogen or by other ($\text{C}_1\text{-C}_8$)alkyl groups.

[0124] In each of Schemes 1, 2 and 3, the position of the heteroaryl ring portion can be changed depending on the starting benzoic acids **i** and **viii**.

[0125] Related compounds can be prepared in a similar manner beginning with, for example, appropriately substituted 2-(5-isoxazolyl)phenols, many of which are available from commercial sources or can be prepared according to literature methods (see Scheme 4).

Scheme 4

- 5 [0126] Similarly, compounds of Formula Ia in which HAr is a pyrazolyl group can be prepared from the corresponding pyrazolylphenols (see Scheme 5).

Scheme 5

10 [0127] In each of Scheme 1-5, reaction conditions (e.g., amounts of reactants, solvents, temperatures and workup conditions) can be selected using the Examples below as a guide.

Preparation of alcohols, esters and aldehydes

- 15 [0128] The above general synthesis schemes are provided to illustrate the prepared of compounds of Formula Ia or Ib in which Y is a carboxylic acid or ester. Conversion of each of these groups into the corresponding alcohols, ethers, or aldehydes can be accomplished using methods generally known to one of skill in the art. Several methods for reduction (and oxidation) are provided below as illustrative of the processess to used in preparing additional
- 20 compounds of the invention.

Conversion of carboxylic acids into aldehydes, carbinols and carbinol esters.

- [0129] The carboxylic acids of this invention can be converted into the corresponding aldehydes, carbinols and carbinol esters by a number of methods, including the routes A-E
- 25 shown in **Scheme 6**. The method to be used in a given case depends on the nature of R, and

the substituents thereon. A variety of useful methods are described in Larock, COMPREHENSIVE ORGANIC TRANSFORMATIONS, VCH Publishers Inc, New York (1989). In particular, methods are described for converting acyl chlorides 2 to aldehydes 3 (p 620), aldehydes 3 to carbinols 4 (p 528ff), esters 5 to aldehydes 3 (p 621), esters 5 to carbinols 4 (p 549), carboxylic acids 1 to carbinols 4 (p 548), carbinols 4 to aldehydes 3 (p 604) and carbinols 4 to esters 6 (p 966).

[0130] In method A, Scheme 6, the carboxylic acid 1 is first converted into the corresponding acid chloride 2. This transformation is effected by reacting the acid 1 with oxalyl chloride, phosphorus pentachloride, or, preferably, thionyl chloride. The reaction is conducted in an aprotic solvent such as dichloromethane, tetrahydrofuran or, preferably, 1,2-dichloroethane. The acid chloride 2 is then converted into the aldehyde 3 by chemical reduction, such as by the use of sodium borohydride in DMF at -70°C, as described in *Tetrahedron Lett.* 22:11 (1981), or, more preferably by hydrogenation using 5% palladium on barium sulfate as catalyst (see, for example, *J. Amer. Chem. Soc.*, 108:2608 (1986)). The reaction is conducted in an aprotic solvent such as toluene or, preferably, xylene. The aldehyde 3 is converted into the carbinol 4 by reduction, for example by reaction with 9-BBN, lithium aluminum tritertiarybutoxy hydride, or more preferably sodium borohydride, (see, *J. Amer. Chem. Soc.* 71:122 (1949)). The reaction is conducted in a protic solvent such as ethanol, or preferably, isopropanol.

[0131] In method B, Scheme 6, the carboxylic acid is first converted into an ester 5, in which R¹ is lower alkyl. This conversion is effected by reacting the acid with a diazoalkane such as diazomethane, or preferably, with a lower alkanol, such as ethanol, in the presence of an acid catalyst. The ester 5 is then converted into the aldehyde 3 by reduction, for example, by the use of sodium aluminum hydride or preferably, diisobutyl aluminum hydride (see, for example, *Synthesis*, 617 (1975)). The reaction is conducted in a non-polar solvent such as benzene or, preferably, toluene.

[0132] The ester 5 is converted into the carbinol 4 by reduction with lithium aluminum hydride or, preferably, with lithium borohydride (see, *J. Amer. Chem. Soc.*, 109:1186 (1987)). The reaction is conducted in an ethereal solvent such as dioxan or, preferably, tetrahydrofuran.

[0133] In method C, Scheme 6, the carboxylic acid 1 is converted into the carbinol 4. This conversion is effected by reacting the carboxylic acid with a reducing agent such as lithium aluminum hydride or, preferably, with diborane, as described in ORGANIC SYNTHESSES,

64:104 (1985). The reaction is conducted in an ethereal solvent such as dioxan or, preferably, tetrahydrofuran.

[0134] In method D, Scheme 6, the carbinol 4 is converted into the aldehyde 3. This conversion is effected by reacting the carbinol with an oxidizing agent such as dicyclohexylcarbodiimide/dimethylsulfoxide, or, preferably, with pyridinium chlorochromate, as described in *Synthesis*, 245 (1982). The reaction is conducted in an aprotic solvent such as dichloromethane or, preferably, 1,2-dichloroethane, optionally in the presence of celite, as described in *J. Org. Chem.*, 50:2626 (1985).

[0135] In method E, Scheme 6, the carbinol 4 is converted into the ester 6. This transformation is effected by an esterification reaction, for example by reacting the carbinol 4 with a carboxylic anhydride (R²CO)₂O, or, preferably, with an acyl chloride R²COCl. The reaction is conducted in an aprotic solvent such as dichloromethane or, preferably, tetrahydrofuran, in the presence of an organic base such as triethylamine or, preferably, pyridine.

Resolution of isomers (enantiomers)

[0136] For many compounds of the present invention, a single chiral center is present (at the carbon atom bearing R^2), resulting in racemic mixtures of enantiomers. As noted above, the present invention further includes compounds, compositions and methods wherein a single isomer (or single enantiomer) is provided or used. Methods of preparing chiral compounds are provided in the Examples. Alternatively, mixtures of enantiomers can be separated into their individual isomers via methods such as salt formation and crystallization with chiral bases, chiral chromatography (e.g., hplc using commercially available columns for chiral resolution) and via methods such as simulated moving bed chromatography (see, for example, U.S. Patent No. 5,518,625).

[0137] In certain preferred embodiments of the invention, the (-)-isomer of the compound of formula Ia or Ib is used, which is substantially free of its (+)-isomer. In this context, "substantially free" refers to a compound that is contaminated by less than about 20%, more preferably 10%, still more preferably 5%, even more preferably 2% and most preferably less than about 1% of the undesired isomer. In other preferred embodiments of the invention, the (+)-isomer of the compound of formula Ia or Ib is used, which is substantially free of its (-)-isomer.

Prodrug forms of the Compounds of the Invention

[0138] In some embodiments, the compounds of the invention are present in a prodrug form. In particular, the invention also provides, for example, compounds of Formula Ia or Ib in which Y is $-CO_2H$ which has been esterified to form $-CO_2R''$, wherein R'' is selected from alkyl, heteroalkyl, aryl, heteroaryl, phenyl-lower alkyl, benzamido-lower alkyl, di-lower alkylamino-lower alkyl, ureido-lower alkyl, N' -lower alkyl-ureido-lower alkyl, carbamoyl-lower alkyl, halophenoxy substituted lower alkyl and carbamoyl substituted phenyl.

Pharmaceutical Compositions and Methods of Treating Diseases and Conditions

[0141] In accordance with the present invention, a therapeutically effective amount of a compound of Formula Ia or Ib can be used for the preparation of a pharmaceutical composition useful for treating diabetes, treating hyperlipidemia, treating hyperuricemia, treating obesity, lowering triglyceride levels, lowering cholesterol levels, raising the plasma level of high density lipoprotein, and for treating, preventing or reducing the risk of developing atherosclerosis.

[0142] The compositions of the invention can include compounds of Formula Ia or Ib, pharmaceutically acceptable salts thereof, or a hydrolyzable precursor thereof. In general, the compound is mixed with suitable carriers or excipient(s) in a therapeutically effective amount. By a "therapeutically effective dose", "therapeutically effective amount", or, interchangeably, "pharmacologically acceptable dose" or "pharmacologically acceptable amount", it is meant that a sufficient amount of the compound of the present invention and a pharmaceutically acceptable carrier, will be present in order to achieve a desired result, e.g., alleviating a symptom or complication of Type 2 diabetes.

[0143] The compounds of Formula Ia or Ib that are used in the methods of the present invention can be incorporated into a variety of formulations for therapeutic administration. More particularly, the compounds of Formula Ia or Ib can be formulated into pharmaceutical compositions by combination with appropriate, pharmaceutically acceptable carriers or diluents, and can be formulated into preparations in solid, semi-solid, liquid or gaseous forms, such as tablets, capsules, pills, powders, granules, dragees, gels, slurries, ointments, solutions, suppositories, injections, inhalants and aerosols. As such, administration of the compounds can be achieved in various ways, including oral, buccal, rectal, parenteral, intraperitoneal, intradermal, transdermal, intratracheal administration. Moreover, the compound can be administered in a local rather than systemic manner, in a depot or sustained release formulation. In addition, the compounds can be administered in a liposome.

[0144] The compounds of Formula Ia or Ib can be formulated with common excipients, diluents or carriers, and compressed into tablets, or formulated as elixirs or solutions for convenient oral administration, or administered by the intramuscular or intravenous routes.

The compounds can be administered transdermally, and can be formulated as sustained release dosage forms and the like. Compounds of Formula Ia or Ib can be administered alone, in combination with each other, or they can be used in combination with other known compounds (see *Combination Therapy* below).

[0145] Suitable formulations for use in the present invention are found in *Remington's Pharmaceutical Sciences* (Mack Publishing Company (1985) Philadelphia, PA, 17th ed.), which is incorporated herein by reference. Moreover, for a brief review of methods for drug delivery, *see*, Langer, *Science* (1990) 249:1527-1533, which is incorporated herein by reference. The pharmaceutical compositions described herein can be manufactured in a manner that is known to those of skill in the art, *i.e.*, by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing processes. The following methods and excipients are merely exemplary and are in no way limiting.

[0146] For injection, the compounds can be formulated into preparations by dissolving, suspending or emulsifying them in an aqueous or nonaqueous solvent, such as vegetable or other similar oils, synthetic aliphatic acid glycerides, esters of higher aliphatic acids or propylene glycol; and if desired, with conventional additives such as solubilizers, isotonic agents, suspending agents, emulsifying agents, stabilizers and preservatives. Preferably, the compounds of the present invention can be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hanks's solution, Ringer's solution, or physiological saline buffer. For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

[0147] For oral administration, the compounds of Formula Ia or Ib can be formulated readily by combining with pharmaceutically acceptable carriers that are well known in the art. Such carriers enable the compounds to be formulated as tablets, pills, dragees, capsules, emulsions, lipophilic and hydrophilic suspensions, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by mixing the compounds with a solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, and/or polyvinylpyrrolidone (PVP). If desired, disintegrating agents can be added, such as the cross-linked polyvinyl pyrrolidone, agar, or alginic acid or a salt thereof such as sodium alginate.

[0148] Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions can be used, which can optionally contain gum arabic, talc, polyvinyl

pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments can be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

5 [0149] Pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds can
10 be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers can be added. All formulations for oral administration should be in dosages suitable for such administration.

[0150] For buccal administration, the compositions can take the form of tablets or lozenges formulated in conventional manner.

15 [0151] For administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray presentation from pressurized packs or a nebulizer, with the use of a suitable propellant, *e.g.*, dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas, or from propellant-free, dry-powder inhalers. In the case of a
20 pressurized aerosol the dosage unit can be determined by providing a valve to deliver a metered amount. Capsules and cartridges of, *e.g.*, gelatin for use in an inhaler or insufflator can be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

[0152] The compounds can be formulated for parenteral administration by injection, *e.g.*,
25 by bolus injection or continuous infusion. Formulations for injection can be presented in unit dosage form, *e.g.*, in ampules or in multidose containers, with an added preservative. The compositions can take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and can contain formulator agents such as suspending, stabilizing and/or dispersing agents.

30 [0153] Pharmaceutical formulations for parenteral administration include aqueous solutions of the active compounds in water-soluble form. Additionally, suspensions of the active compounds can be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils such as sesame oil, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. Aqueous injection suspensions can contain

substances which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension can also contain suitable stabilizers or agents which increase the solubility of the compounds to allow for the preparation of highly concentrated solutions. Alternatively, the active ingredient can be in powder form for constitution with a suitable vehicle, *e.g.*, sterile pyrogen-free water, before use.

[0154] The compounds can also be formulated in rectal compositions such as suppositories or retention enemas, *e.g.*, containing conventional suppository bases such as cocoa butter, carbowaxes, polyethylene glycols or other glycerides, all of which melt at body temperature, yet are solidified at room temperature.

[0155] In addition to the formulations described previously, the compounds can also be formulated as a depot preparation. Such long acting formulations can be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds can be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

[0156] Alternatively, other delivery systems for hydrophobic pharmaceutical compounds can be employed. Liposomes and emulsions are well known examples of delivery vehicles or carriers for hydrophobic drugs. In a presently preferred embodiment, long-circulating, *i.e.*, stealth liposomes can be employed. Such liposomes are generally described in Woodle, *et al.*, U.S. Patent No. 5,013,556. The compounds of the present invention can also be administered by controlled release means and/or delivery devices such as those described in U.S. Pat. Nos. 3,845,770; 3,916,899; 3,536,809; 3,598,123; and 4,008,719.

[0157] Certain organic solvents such as dimethylsulfoxide (DMSO) also can be employed, although usually at the cost of greater toxicity. Additionally, the compounds can be delivered using a sustained-release system, such as semipermeable matrices of solid hydrophobic polymers containing the therapeutic agent. Various types of sustained-release materials have been established and are well known by those skilled in the art. Sustained-release capsules can, depending on their chemical nature, release the compounds for a few hours up to over 100 days.

[0158] The pharmaceutical compositions also can comprise suitable solid or gel phase carriers or excipients. Examples of such carriers or excipients include but are not limited to calcium carbonate, calcium phosphate, various sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene glycols.

[0159] Pharmaceutical compositions suitable for use in the present invention include compositions wherein the active ingredients are contained in a therapeutically effective amount. The amount of composition administered will, of course, be dependent on the subject being treated, on the subject's weight, the severity of the affliction, the manner of administration and the judgment of the prescribing physician. Determination of an effective amount is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.

[0160] For any compound used in the method of the present invention, a therapeutically effective dose can be estimated initially from cell culture assays or animal models.

[0161] Moreover, toxicity and therapeutic efficacy of the compounds described herein can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, *e.g.*, by determining the LD₅₀, (the dose lethal to 50% of the population) and the ED₅₀ (the dose therapeutically effective in 50% of the population). The dose ratio between toxic and therapeutic effect is the therapeutic index and can be expressed as the ratio between LD₅₀ and ED₅₀. Compounds which exhibit high therapeutic indices are preferred. The data obtained from these cell culture assays and animal studies can be used in formulating a dosage range that is not toxic for use in human. The dosage of such compounds lies preferably within a range of circulating concentrations that include the ED₅₀ with little or no toxicity. The dosage can vary within this range depending upon the dosage form employed and the route of administration utilized. The exact formulation, route of administration and dosage can be chosen by the individual physician in view of the patient's condition. (*See, e.g., Fingl et al. 1975 In: The Pharmacological Basis of Therapeutics, Ch. 1*).

[0162] The amount of active compound that can be combined with a carrier material to produce a single dosage form will vary depending upon the disease treated, the mammalian species, and the particular mode of administration. However, as a general guide, suitable unit doses for the compounds of the present invention can, for example, preferably contain between 100 mg to about 3000 mg of the active compound. A preferred unit dose is between 500 mg to about 1500 mg. A more preferred unit dose is between 500 to about 1000 mg. Such unit doses can be administered more than once a day, for example 2, 3, 4, 5 or 6 times a day, but preferably 1 or 2 times per day, so that the total daily dosage for a 70 kg adult is in the range of 0.1 to about 250 mg per kg weight of subject per administration. A preferred dosage is 5 to about 250 mg per kg weight of subject per administration, and such therapy can extend for a number of weeks or months, and in some cases, years. It will be understood, however, that the specific dose level for any particular patient will depend on a variety of

factors including the activity of the specific compound employed; the age, body weight, general health, sex and diet of the individual being treated; the time and route of administration; the rate of excretion; other drugs which have previously been administered; and the severity of the particular disease undergoing therapy, as is well understood by those of skill in the area.

[0163] A typical dosage can be one 10 to about 1500 mg tablet taken once a day, or, multiple times per day, or one time-release capsule or tablet taken once a day and containing a proportionally higher content of active ingredient. The time-release effect can be obtained by capsule materials that dissolve at different pH values, by capsules that release slowly by osmotic pressure, or by any other known means of controlled release.

[0164] It can be necessary to use dosages outside these ranges in some cases as will be apparent to those skilled in the art. Further, it is noted that the clinician or treating physician will know how and when to interrupt, adjust, or terminate therapy in conjunction with individual patient response.

Combination Therapy

[0165] As noted above, the compounds of the present invention will, in some instances, be used in combination with other therapeutic agents to bring about a desired effect. Selection of additional agents will, in large part, depend on the desired target therapy (*see, e.g.*, Turner, N. *et al. Prog. Drug Res.* (1998) 51: 33-94; Haffner, S. *Diabetes Care* (1998) 21: 160-178; and DeFronzo, R. *et al.* (eds.), *Diabetes Reviews* (1997) Vol. 5 No. 4). A number of studies have investigated the benefits of combination therapies with oral agents (*see, e.g.*, Mahler, R., *J. Clin. Endocrinol. Metab.* (1999) 84: 1165-71; United Kingdom Prospective Diabetes Study Group: UKPDS 28, *Diabetes Care* (1998) 21: 87-92; Bardin, C. W., (ed.), *CURRENT THERAPY IN ENDOCRINOLOGY AND METABOLISM*, 6th Edition (Mosby - Year Book, Inc., St. Louis, MO 1997); Chiasson, J. *et al.*, *Ann. Intern. Med.* (1994) 121: 928-935; Coniff, R. *et al.*, *Clin. Ther.* (1997) 19: 16-26; Coniff, R. *et al.*, *Am. J. Med.* (1995) 98: 443-451; and Iwamoto, Y. *et al.*, *Diabet. Med.* (1996) 13 365-370; Kwiterovich, P. *Am. J. Cardiol* (1998) 82(12A): 3U-17U). These studies indicate that diabetes and hyperlipidemia modulation can be further improved by the addition of a second agent to the therapeutic regimen. Combination therapy includes administration of a single pharmaceutical dosage formulation which contains a compound having the general structure of Formula Ia or Ib and one or more additional active agents, as well as administration of a compound of Formula Ia or Ib and each active agent in its own separate pharmaceutical dosage formulation. For example, a compound of Formula

Ia or Ib and an HMG-CoA reductase inhibitor can be administered to the human subject together in a single oral dosage composition, such as a tablet or capsule, or each agent can be administered in separate oral dosage formulations. Where separate dosage formulations are used, a compound of Formula Ia or Ib and one or more additional active agents can be administered at essentially the same time (*i.e.*, concurrently), or at separately staggered times (*i.e.*, sequentially). Combination therapy is understood to include all these regimens.

[0166] An example of combination therapy that modulates (prevents the onset of the symptoms or complications associated) atherosclerosis, wherein a compound of Formula Ia or Ib is administered in combination with one or more of the following active agents: an antihyperlipidemic agent; a plasma HDL-raising agent; an antihypercholesterolemic agent, such as a cholesterol biosynthesis inhibitor, *e.g.*, an hydroxymethylglutaryl (HMG) CoA reductase inhibitor (also referred to as statins, such as lovastatin, simvastatin, pravastatin, fluvastatin, and atorvastatin), an HMG-CoA synthase inhibitor, a squalene epoxidase inhibitor, or a squalene synthetase inhibitor (also known as squalene synthase inhibitor); an acyl-coenzyme A cholesterol acyltransferase (ACAT) inhibitor, such as melinamide; probucol; nicotinic acid and the salts thereof and niacinamide; a cholesterol absorption inhibitor, such as β -sitosterol; a bile acid sequestrant anion exchange resin, such as cholestyramine, colestipol or dialkylaminoalkyl derivatives of a cross-linked dextran; an LDL (low density lipoprotein) receptor inducer; fibrates, such as clofibrate, bezafibrate, fenofibrate, and gemfibrozil; vitamin B₆ (also known as pyridoxine) and the pharmaceutically acceptable salts thereof, such as the HCl salt; vitamin B₁₂ (also known as cyanocobalamin); vitamin B₃ (also known as nicotinic acid and niacinamide, *supra*); anti-oxidant vitamins, such as vitamin C and E and beta carotene; a beta-blocker; an angiotensin II antagonist; an angiotensin converting enzyme inhibitor; and a platelet aggregation inhibitor, such as fibrinogen receptor antagonists (*i.e.*, glycoprotein IIb/IIIa fibrinogen receptor antagonists) and aspirin. As noted above, the compounds of Formula Ia or Ib can be administered in combination with more than one additional active agent, for example, a combination of a compound of Formula Ia or Ib with an HMG-CoA reductase inhibitor (*e.g.*, lovastatin, simvastatin and pravastatin) and aspirin, or a compound of Formula Ia or Ib with an HMG-CoA reductase inhibitor and a β blocker.

[0167] Another example of combination therapy can be seen in treating obesity or obesity-related disorders, wherein the compounds of Formula Ia or Ib can be effectively used in combination with, for example, phenylpropanolamine, phentermine, diethylpropion, mazindol; fenfluramine, dexfenfluramine, phentiramine, β_3 adrenoceptor agonist agents;

sibutramine, gastrointestinal lipase inhibitors (such as orlistat), and leptins. Other agents used in treating obesity or obesity-related disorders wherein the compounds of Formula Ia or Ib can be effectively used in combination with, for example, neuropeptide Y, enterostatin, cholecystokinin, bombesin, amylin, histamine H₃ receptors, dopamine D₂ receptors, melanocyte stimulating hormone, corticotrophin releasing factor, galanin and gamma amino butyric acid (GABA).

[0168] Still another example of combination therapy can be seen in modulating diabetes (or treating diabetes and its related symptoms, complications, and disorders), wherein the compounds of Formula Ia or Ib can be effectively used in combination with, for example, sulfonylureas (such as chlorpropamide, tolbutamide, acetohexamide, tolazamide, glyburide, gliclazide, glynase, glimepiride, and glipizide), biguanides (such as metformin), thiazolidinediones (such as ciglitazone, pioglitazone, troglitazone, and rosiglitazone); dehydroepiandrosterone (also referred to as DHEA or its conjugated sulphate ester, DHEA-SO₄); antigluco-corticoids; TNF α inhibitors; α -glucosidase inhibitors (such as acarbose, miglitol, and voglibose), pramlintide (a synthetic analog of the human hormone amylin), other insulin secretagogues (such as repaglinide, gliquidone, and nateglinide), insulin, as well as the active agents discussed above for treating atherosclerosis.

[0169] A further example of combination therapy can be seen in modulating hyperlipidemia (treating hyperlipidemia and its related complications), wherein the compounds of Formula Ia or Ib can be effectively used in combination with, for example, statins (such as fluvastatin, lovastatin, pravastatin or simvastatin), bile acid-binding resins (such as colestipol or cholestyramine), nicotinic acid, probucol, betacarotene, vitamin E, or vitamin C.

[0170] Additionally, an effective amount of a compound of Formula Ia or Ib and a therapeutically effective amount of one or more active agents selected from the group consisting of: an antihyperlipidemic agent; a plasma HDL-raising agent; an antihypercholesterolemic agent, such as a cholesterol biosynthesis inhibitor, for example, an HMG-CoA reductase inhibitor, an HMG-CoA synthase inhibitor, a squalene epoxidase inhibitor, or a squalene synthetase inhibitor (also known as squalene synthase inhibitor); an acyl-coenzyme A cholesterol acyltransferase inhibitor; probucol; nicotinic acid and the salts thereof; niacinamide; a cholesterol absorption inhibitor; a bile acid sequestrant anion exchange resin; a low density lipoprotein receptor inducer; clofibrate, fenofibrate, and gemfibrozil; vitamin B₆ and the pharmaceutically acceptable salts thereof; vitamin B₁₂; an anti-oxidant vitamin; a β -blocker; an angiotensin II antagonist; an angiotensin converting

enzyme inhibitor; a platelet aggregation inhibitor; a fibrinogen receptor antagonist; aspirin; phentiramines, β_3 adrenergic receptor agonists; sulfonylureas, biguanides, α -glucosidase inhibitors, other insulin secretagogues, and insulin can be used together for the preparation of a pharmaceutical composition useful for the above-described treatments.

5 Kits

[0171] In addition, the present invention provides for kits with unit doses of the compounds of Formula Ia or Ib, either in oral or injectable doses. In addition to the containers containing the unit doses will be an informational package insert describing the use and attendant benefits of the drugs in alleviating symptoms and/or complications associated with Type 2
10 diabetes as well as in alleviating hyperlipidemia and hyperuricemia, or for alleviating conditions dependent on PPAR. Preferred compounds and unit doses are those described herein above.

[0172] For the compositions, methods and kits provided above, one of skill in the art will
15 understand that preferred compounds for use in each are those compounds that are preferred above and particularly those compounds provided in formulae IIa through IIat, and IIIa through IIIt in Figures 2, 3, 4A, 4B, 5A, 5B and 5C. Still further preferred compounds for the compositions, methods and kits are those compounds provided in the Examples below.

EXAMPLES

Experimental Section

[0173] **General Methods.** All operations involving moisture and/or oxygen sensitive materials were conducted under an atmosphere of dry nitrogen in pre-dried glassware. Unless noted otherwise, materials were obtained from commercially available sources and used without further purification.

[0174] Flash chromatography was performed on E. Merck silica gel 60 (240-400 mesh) according to the protocol of Still, Kahn, and Mitra (*J. Org. Chem.* **1978**, *43*, 2923). Thin layer chromatography was performed using precoated plates purchased from E. Merck (silica gel 60 PF₂₅₄, 0.25 mm) and spots were visualized with long-wave ultraviolet light followed by an appropriate staining reagent.

[0175] Nuclear magnetic resonance (NMR) spectra were recorded on a Varian Inova-400 resonance spectrometer. ¹H NMR chemical shifts are given in parts per million (δ) downfield from tetramethylsilane (TMS) using TMS or the residual solvent signal (CHCl₃ = δ 7.24, DMSO = δ 2.50) as internal standard. ¹H NMR information is tabulated in the following format: number of protons, multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet), coupling constant(s) (*J*) in hertz, and, in selected cases, position assignment. The prefix *app* is occasionally applied in cases where the true signal multiplicity was unresolved and *br* indicates the signal in question was broadened.

[0176] Combustion analyses were performed by Robertson Microlit Laboratories, Inc. (Madison, N.J.) and optical rotations were measured on Perkin-Elmer 241 MC polarimeter and reported as: $[\alpha]_{\lambda}^T$ (*c* = (g/100 mL), solvent).

[0177] Two routes are illustrated below which are useful in preparing the compounds disclosed in this invention. In **Route I**, α-bromo-phenylacetate **S-1** was treated with a phenol, aniline or benzenethiol **S-2** under basic condition to yield α-phenoxy-, α-phenylamino- or α-phenylsulfanyl-phenylacetate **S-3**. Hydrolysis of **S-3** under basic condition yielded the corresponding acid **S-4**. Alternatively, **S-3** was alkylated with a corresponding alkyl halide followed by basic hydrolysis to afford the alkylated acid **S-5**. In **route B**, intermediates **S-7** with an electron withdrawing R₁ such as 4-CF₃ were treated with α-hydroxy, amino, or mercapto-phenyl acetic acid **S-6** under strongly basic condition to afford phenylacetic acid **S-8** directly.

Figure 1. General Reaction Schemes

- 5 [0178] The compounds listed in **Tables 1** through **Table 12** were either synthesized or can be synthesized by the reaction routes and examples illustrated throughout the experimental section. All the intermediates and final products can be prepared by known procedures or by those skilled in the arts.

[0179] Scheme 1 illustrates the general preparative routes for the synthesis of substituted α -bromo-phenylacetates, α -hydroxy-phenylacetic acids and α -hydroxy-phenylacetates. All of the intermediates can be prepared by known procedures or by those skilled in the arts.

Synthesis of substituted α -bromo-phenylacetate, α -hydroxy-phenylacetic acid and α -hydroxy-phenylacetate

Example 1

[0180] A 2 L three neck roundbottom flask was equipped with an efficient condenser attached to an acid scrubber, a magnetic stir bar, and was placed under nitrogen. 4-Chlorophenylacetic acid (200 g) and 1000 mL of 1,2-dichloroethane were added, followed by thionyl chloride (103.6 mL). The condenser was cooled with 4°C water. The mixture was heated to an internal temperature of 55-60°C. Gas evolution was observed and the solid dissolved as the internal temperature rose to 55-60°C over 45 min. Bromine (66 mL) was added and the mixture was maintained at 55-60°C for 18 h. The internal temperature was then raised to 80-85°C over 1.5 h and heating was continued for 18h. The solution was cooled to room temperature, and 247 mL of ethanol was added slowly at 0 °C. The solution was washed with water and dried over anhydrous sodium sulfate. The solvent was removed

Example 5

[0184] To a solution of (α, α, α -trifluoro-*m*-tolyl)acetic acid **SI-8** (202.36 g, 0.99 mol) in absolute ethanol (1.0 L) at 0 °C was added thionyl chloride (79 mL, 1.05 mol), and the

resulting solution was refluxed for 3 h. Concentration *in vacuo* gave a residue which was partitioned between EtOAc and water. The organic layer was washed with sat. NaHCO₃ and brine, dried over Na₂SO₄ and concentrated *in vacuo* to afford 220.1 g (96%) of crude ethyl ester **SI-9** as a pale yellow liquid. To a mixture of crude ethyl ester **SI-9** (119.15 g, ca. 0.51 mol) and NBS (100.48 g, 0.56 mol) in CCl₄ (1.0 L) was added benzoyl peroxide (1.0 g). The resulting mixture was heated at 75 °C for 20 min. and then refluxed at 90 °C overnight (14 h) until the brown mixture became nearly colorless with white precipitate. The mixture was cooled to 0 °C, filtered through a pad of celite, and concentrated *in vacuo* to afford 151.27 g (95%) of bromide **SBr-5** as a pale brown liquid. The product was sufficiently pure to be used directly in the subsequent substitution reaction. This product was also prepared by refluxing (α, α, α-trifluoro-*m*-tolyl)acetic acid **SI-8** with bromine in the presence of SOCl₂, and then quenching with EtOH. ¹H NMR (400 MHz, CDCl₃): δ 7.80 (1H, s), 7.77 (1H, d, *J* = 7.6 Hz), 7.61 (1H, d, *J* = 8.0 Hz), 7.51 (1H, t, *J* = 7.8 Hz), 5.35 (1H, s), 4.26 (2H, q), 1.30 (3H, t).

[0190] To a mixture of 4-(trifluoromethyl)-benzaldehyde **SI-20** (25 g), a catalytic amount of KCN and 18-crown-6 in dichloromethane (150 mL) was added slowly TMSCN (21.0 mL)

at 0 °C. The reaction mixture was stirred at room temperature overnight and washed with aqueous sodium bicarbonate solution. The solvent was removed under vacuum to give a crude cyano product.

[0191] The above cyano product was dissolved in methanol, and HCl gas was then bulbed through for several minutes at 0 °C. The solution was stirred overnight at room temperature, neutralized with aqueous NaOH solution, concentrated, and extracted with ethyl acetate. The organic solution was dried over anhydrous sodium sulfate and concentrated. Purification with flash column chromatography (hexanes/ethyl acetate 1/5) gave the desired hydroxyl product **SI-22** (28.75 g, 86%) as a colorless oil. ¹H-NMR (DMSO, 400MHz): δ 7.58 (m, 4H), 5.21 (s, 1H), 3.70 (s, 3H).

2. Synthesis of 2-benzooxazol-2-yl-phenols

[0197] Scheme 2 illustrates the general route for preparing 2-benzooxazol-2-yl-phenols or 2-benzooxazol-2-yl-phenylfluorides. Generally, 2-fluoro or 2-hydroxyl benzoic acid was transformed to the corresponding acyl chloride. The acyl chlorides were then reacted with aminophenols and were further dehydrated to afford the corresponding 2-benzooxazol-2-yl-phenols or 2-benzooxazol-2-yl-phenylfluorides. 2-benzooxazol-2-yl-phenylfluorides were converted to 2-benzooxazol-2-yl-phenols by reacting with sodium methoxide followed by demethylation. All of the intermediates can be prepared by known procedures or by those skilled in the arts.

Example 18

10 [0199] A mixture of **SI-32** (19.24 g, 0.111 mol) and SOCl₂ (30 mL) was refluxed for 2h. The mixture was concentrated to dryness and further dried under vacuum. To the residue was added 2-aminophenol (18.2 g, 0.167 mol) in CH₂Cl₂ (500 mL). To the solution was slowly added Et₃N (31 mL, 0.22 mol) at 0°C and the reaction was allowed to warm to room temperature and stirred overnight. The reaction mixture was concentrated to dryness. To the

- [0205] 2-Fluoro-5-(trifluoromethyl)benzoyl chloride **SI-37** was commercially obtained from Aldrich, or prepared by refluxing a solution of 2-fluoro-5-(trifluoromethylmethyl)benzoid acid **SI-36** (116.71 g, 0.56 mol) and thionyl chloride (81.0 mL, 1.11 mol) in 1,2-dichloroethane (250 mL) at 80 °C for 0.5 h. **Step A.** To a solution of 2-fluoro-5-(trifluoromethyl)benzoyl chloride **SI-37** (25.7 g, 0.11 mol) and 2-aminophenol (13.87 g, 0.13 mol) in CH_2Cl_2 (350 mL) at 0 °C was added Et_3N (18 mL, 0.13 mol). The resulting mixture was stirred at 0 °C to rt overnight, diluted with EtOAc and washed with water. The organic layer was washed with water and brine, dried over Na_2SO_4 and concentrated *in vacuo* to afford crude **SI-38** (35 g). **Step B.** To a suspension of unpurified **SI-38** (35 g, 0.11 mol) in toluene (500 mL) was added TsOH monohydrate (6.78 g, 0.035 mol). The resulting suspension was refluxed at 80 °C with a Dean-Stork condenser for 7 h. The

reaction mixture was cooled to rt, concentrated *in vacuo*, diluted with EtOAc, washed with H₂O, then washed with sat. NaHCO₃ and brine, dried over Na₂SO₄ and concentrated *in vacuo* to afford crude **PhF-1** (31.66g, 99% over two steps) as an off-white solid. ¹H NMR (400 MHz, CDCl₃): δ 8.56 (1H, d, *J* = 6.0 Hz), 7.85–7.87 (1H, m), 7.78–7.81 (1H, m), 7.64–7.67

5 (1H, m), 7.41–7.44 (3H, m) ppm. **Step C.** To a solution of unpurified **PhF-1** (31.62 g, 0.11 mol) in THF (200 mL) at –5 °C was added NaOMe (8.95 g, 0.16 mol). NH₄Cl, dried over Na₂SO₄ and concentrated *in vacuo* to afford crude **SI-39** (31.89 g) as an off-white solid. This

CH₂Cl₂ (500 mL) at –78 °C was treated with BBr₃ (17 mL, 0.18
15 mol). The resultant cloudy solution was warmed to –10 °C over 2 h and stirred at rt for another 2 h. The reaction mixture was cooled to 0 °C and quenched with water.

Concentration *in vacuo* gave a residue which was partitioned between EtOAc and water. The organic layer was washed with water, sat. NaHCO₃ and brine, dried over Na₂SO₄ and concentrated *in vacuo* to afford crude **PhOH-6** (31.31 g, 99.7% over 2 steps) as a white solid.

3. Synthesis of Compounds I and Ia in Table 1

[0207] One or two routes illustrated in Scheme 3 were used to prepare the compounds I and Ia listed in Table 1. In route A, α -bromo-phenylacetate was treated with 2-benzoxazolyl-phenol under basic condition to yield α -phenoxy-phenylacetate SI-40. Hydrolysis of SI-40 under basic condition yielded α -phenoxy-phenylacetic acid I-X. Alternatively, SI-40 was alkylated with a corresponding alkyl halide followed by basic hydrolysis to afford α -phenoxy-phenylacetic acid Ia-X. In route B, intermediates PhF-X with an electron withdrawing R^1 such as a 4- CF_3 group were treated with α -hydroxy-phenyl acetic acid SOH-X under strongly basic condition to afford α -phenoxy-phenylacetic acid I-X or Ia-X directly. All of the intermediates can be prepared by known procedures or by those skilled in the arts.

wavelength were: 40% *i*PrOH-60% Hexanes-0.1% TFA, 30 mL/min., $\lambda=220$ nm. For (+)-isomer: RT 4.2 min. For (-)-isomer: RT 7.5 min.

Example 59

[0245] A suspension of **I-191** (37.44 g, 0.084 mol) in 750 mL of EtOH 3A was heated to reflux at 90 °C (water-bath temperature) to give a cloudy solution, then cooled to ca. 80 °C. Quinine (25.34 g, 0.078 mol) was added, and the resulting clear solution was stirred at 70–80 °C. (internal solution temperature) and solid began to crash out of the hot solution. After stirring for 1 h at 70–80 °C, and then cooled to 50°C with stirring. The solid was collected by filtration and rinsed twice with EtOH 3A. The dried solid (ca. 33 g) had an 90–93% enantiomeric excess (ee) of the (+) enantiomer, and the mother liquor had an 85–90% enantiomeric excess (ee) of the (–) enantiomer. When this hot mother liquor was cooled to rt, a second crop solid (17.0g) was obtained. This solid had a 99% ee of the (–)-enantiomer. Chiral HPLC analysis was carried out at $\lambda = 220$ nm by injecting 10 μ L of an approximately a 0.5 mg/mL solution of the sample dissolved in mobile phase onto a 25 cm \times 4.6 mm Regis Technologies (R,R) Whelk-O 1 5 μ m column with a 1.5 mL/min flow of (25/75/0.1) *i*PrOH/hexanes/TFA. Under these conditions, (+) enantiomer **I-367** eluted at 4.3 min, and (–) enantiomer at 5.8 min (approximate retention times). To the crude (+) salt (33 g) obtained above was added 520 mL of EtOH 3A, and the suspension was refluxed at 106 °C (oil-bath temperature)-for 3 h, cooled to rt, filtered and rinsed twice with EtOH 3A. The white solid was dried to afford 28.32 g of the desired (+) enantiomer salt with an ee of 97–99%. To a suspension of the resolved salt (28 g) in 350 mL of EtOAc was added 45 mL of 2N H₂SO₄. After stirring for 10 min at rt, the resulting mixture was diluted with water (100 mL). The organic layer was separated and washed with water twice and then brine and dried over Na₂SO₄. After removal of solvents *in vacuo* and dried at 40–45 °C / 3 mmHg, 16.26 g of desired (+) enantiomer **I-367** was obtained. Similarly, (+) enantiomer **I-367** was also obtained

by resolution of racemic **I-191** using cinchonidine (0.9 eq.) in EtOH 3A with 60% recovery of (+) enantiomer with a 97–99% ee.

Example 60

[0246] (+) enantiomer **I-365** and (–) enantiomer **I-366** were obtained by resolution of racemic **I-89** using *N*-methyl-*D*-glucamine (0.9 eq.) in EtOH 3A by a similar procedure as **Example 59** above. Chiral HPLC analysis was carried out at $\lambda = 220$ nm by injecting 10 μ L of a 0.5 mg/mL solution of the sample dissolved in mobile phase onto a 25 cm \times 4.6 mm Regis Technologies (R,R) Whelk-O 1 5 μ m column with a 1.5 mL/min flow of (15/85/0.1) *i*PrOH/hexanes/TFA. Under these conditions, (+) enantiomer **I-377** eluted at 4.5 min, and (–) enantiomer at 5.9 min (approximate retention times).

Example 61

[0247] To a solution of **SOH-15** (0.62 g, 3.73 mmol) in THF (10 mL) was added NaHMDS (1.0 M in THF, 7.83 mL) at -10°C and the reaction was warmed to room temperature. After stirring at room temperature for 10 min., a solution of **PhF-1** (1.05 g, 3.73 mmol) in THF (10 mL) was added. The reaction mixture was heated at 60°C for 1 h, and then stirred overnight at room temperature. The reaction was quenched with 1 N HCl solution, extracted with EtOAc, washed with brine, dried and concentrated. The residue was purified by flash column (hexane/EtOAc 10:1) to give compound **Ia-365** as a white solid (0.72 g, 45%). ^1H NMR (d-DMSO, 400 MHz) δ 8.38 (d, 1H), 7.89 (m, 2H), 7.81 (m, 3H), 7.48 (m, 4H), 7.36 (m, 1H), 7.07 (d, 1H), 2.0 (s, 3H).

Example 62

[0248] **Ia-366** was obtained as a white solid from **PhF-1** and **SOH-16** in the same manner as that described in **Example 61**. ^1H NMR (d-DMSO, 400 MHz) δ 8.38 (d, 1H), 7.89 (m, 2H), 7.81 (m, 3H), 7.48 (m, 4H), 7.36 (m, 1H), 7.07 (d, 1H), 2.0 (s, 3H).

5. Synthesis of 2-benzothiazol-2-yl-phenols

[0249] The 2-benzothiazol-2-yl-phenol or 2-benzothiazol-2-yl-phenylfluorides used for the preparation of compounds **II-X** and **IIa-X** were prepared in the same manner as that described for the synthesis of 2-benzooxazol-2-yl-phenols and 2-benzooxazol-2-yl-phenylfluorides illustrated in **Scheme II** or can be prepared by those skilled in the arts.

Example 63

[0250] Compound **PhOH-11** was purchased from Aldrich Chemicals Inc., USA.

Example 64

[0251] A mixture of **SI-32** (67 g, 0.388 mol) and SOCl₂ (42 mL, 0.582) was refluxed for 2h. The mixture was concentrated to dryness and put on high vacuum for a while. To the residue was added THF (700 mL) and then 2-aminothiophenol (53.4 g, 0.427 mol) was added slowly at 0 °C. To the resulted solution was added dropwise Et₃N (82 mL, 0.582 mol) at 0

°C, then warmed to room temperature and stirred overnight. The reaction mixture was acidified by adding 2N HCl and concentrated, to the residue was added water, filtered and washed with water to give a solid (98 g), which was used for the next reaction without further purification.

- 5 [0252] A mixture of the above crude product (98 g) and TsOH·H₂O (12.5 g) in toluene (500 mL) was refluxed for 4 hours using Dean-Stark apparatus. The reaction mixture was cooled to room temperature. Filtration and washing with MeOH gave phenol **PhOH-12** as an off-white solid (90 g, 89%). ¹HNMR (d-DMSO, 400 MHz) δ 11.69 (s, 1H), 8.20 (d, 1H), 8.08 (d, 1H), 8.04 (d, 1H), 7.53-7.39 (m, 3H), 7.08 (d, 1H).

Example 91

- [0283] A mixture of PhF-1 (1.124 g, 4.0 mmol), SVI-4 (0.914 g, 4.40 mmol) and iPr₂NEt (1.32 mL, 7.6 mmol) in DMF (10 mL) was heated at 100 °C for 24 h. After cooling to room temperature the mixture was poured into a mixture of ice and water and extracted with EtOAc. The organic layer was washed with brine, dried and concentrated. The residue was recrystallized from MeOH to give a white solid (0.6g).
- [0284] To the above product in THF/MeOH (15 mL/30mL) was added 1M LiOH solution (10 mL). The mixture was heated at 70 °C for 0.5 h, cooled to room temperature and quenched by adding 1 N HCl (10 mL). The mixture was concentrated and extracted with EtOAc. The organic layer washed with water, dried and concentrated. Crystallization from MeOH gave VI-63 as a white solid (0.45 g). ¹H NMR (d-DMSO, 400 MHz) δ 9.87 (d, 1H), 8.28 (d, 1H), 7.85 (m, 2H), 7.60 (dd, 1H), 7.50 (m, 7H), 6.83 (d, 1H), 5.61 (d, 1H).

Example 107

10

[0306] Nitro aniline (138.13 g) was mixed with 500 mL of concentrated HCl and stirred for several min. When all the aniline was dissolved, the solution was cooled down to room

temperature and diluted with water (300 mL), and then a solution of NaNO₂ (69 g) in 250 mL of water was dropwise added at 0 °C. The solution became a clear and yellowish solution. The diazonium salt solution was added slowly to a solution of phenol (128.5 g) in water (800mL) containing 80 g of NaOH at 0 °C. When the addition was complete, the reaction mixture was stand for several hours, a black precipitate was formed and filtered. The solid was dissolved in ethyl acetate, washed with brine, dried over anhydrous Na₂SO₄. The solution was concentrated to give 133.5 g of nitroazophenol product as light yellow solid. The mother liquor was concentrated again to give another 65 g of the nitroazophenol product. ¹H-NMR (400 MHz, CDCl₃): δ 10.98 (s, 1H), 8.20 – 7.05 (m, 7H).

- 10 [0307] A mixture of nitroazophenol (40 g), thiourea dioxide (30 g), 500 mL of NaOH solution (4 N) and 500 mL ethanol was stirred for half an hour at 80 °C, and then 15 g of thiourea dioxide was added. The solution was stirred for another one hour, diluted with ice-water, extracted with ethyl acetate, dried over anhydrous Na₂SO₄. The solution was concentrated to give 21 g of **PhOH-45** as a white solid. ¹H-NMR (400 MHz, CDCl₃): δ 11.25 (s, 1H), 8.40 – 7.15 (m, 7H).

Example 108

- 20 [0308] In the same manner as that described in Example 107, **PhOH-46** was prepared from phenol **SXI-3**. ¹H-NMR (400 MHz, CDCl₃): δ 11.78 (s, 1H), 8.71 – 7.23 (m, 7H).

Example 109

[0309] PhOH-47 can be prepared from SXI-1 and SXI-4 in the same manner as that described in Example 107.

22. Synthesis of compound XIV-X listed in Table 14.

[0339] Compounds XIV-X listed in Table 14 were or can be prepared with SBr-14, 15, 16, 17 and 18 and PhOH-X in the same manner as described in Example 28 Step A.

Alternatively, they were or can be prepared from esterification of the corresponding acids in the same manner as that described in Examples 136 to 138.

Example 131

[0340] A 500 mL three neck roundbottom flask was equipped with an efficient condenser attached to an acid scrubber, a magnetic stir bar, and placed under argon. 4-Chlorophenylacetic acid SI-5 (99.9 g, 0.50 mole) was charged, followed by thionyl chloride (50.0 mL (81.6 g), 0.68 mole). The condenser was cooled with 4°C water. The mixture was heated to an internal temperature of 55-60°C. Gas evolution was observed and the solids dissolved as the internal temperature rose to 55-60°C over 45 min.. The mixture was then stirred at 55-60°C for 45 min.. Bromine (33.0 mL (102.4 g), 0.65 mole) was charged and the mixture maintained at 55-60°C for 18 h. The internal temperature was then raised to 80-85°C over 1.5 h and heating continued for 18h (based on other runs, the reaction is complete after 6-7h). The mixture was cooled to 20-25°C and anhydrous dichloromethane (500 mL) added. In a separate flask was placed 2-acetylanthanolamine (190 mL (213 g), 2.07 mole) and anhydrous dichloromethane (500 mL) under argon and the mixture cooled to 2.8°C. To this

was added the acyl halide solution at such a rate as to keep the internal temperature below 21 °C (caution: exothermic). After the addition was complete (approx. 20 min.), the mixture was stirred in the cold bath for 0.5h, at which time the internal temperature was 4.8 °C. This mixture was carefully added to 1.5 L water containing sodium bicarbonate (148 g , 1.8 mole) at such a rate that frothing was moderate. The pH at the end of the addition (15 min.) was 7, by pH paper. Sodium thiosulfate (18.7 g, 0.12 mole) was added in portions and gas evolution was observed. Bromine was found to be absent at this time by testing with a Peroxid 100 (quantifix) strip. The layers were then partitioned in a separatory funnel (100 mL dichloromethane used in transfer), and the organic phase extracted with 250 mL water, dried over magnesium sulfate (17 g), and filtered. The filter cake was washed with dichloromethane (150 mL). Rotary evaporation and pumping at high vacuum afforded an oil, which was slurried in 100 mL hexane: ethyl acetate (70:30). Additional hexane (300 mL) was added until a white color formed in the top layer of the biphasic mixture. Vigorous agitation afforded a solid, which was filtered away from the supernatant to yield crude (2-acetamidoethyl)-4-chlorophenylbromoacetate **SBr-14** (147g) as a light tan solid.

Example 135

[0344] In the same manner as that described in **Example 28 Step A**, compound **XIV-11** was prepared from **SBr-15** and **PhOH-2**.

23. Enantiomers Preparation

[0345] The enantiomers of compounds **XIV-X** can be obtained from the corresponding enantiomerically pure acids with esterification as that described in **Example 136**, **Example**

137 and Example 138. Alternatively, it can be obtained from the (+/-) racemic mixture with a chiral HPLC separation as that described in **Section 4**.

Example 136

[0346] A mixture of **I-367** (11.74 g, ee >99.9%), N-acetyethanolamine (13.51 g) and TsOH monohydrate (0.25 g) in toluene (200 mL) was refluxed overnight using a Dean-Stark apparatus. The reaction mixture was concentrated to dryness, water was added, and the resultant mixture was stirred at room temperature for 0.5 h. Filtration and washing with water gave a off-white solid, which was recrystallized from iPrOH-hexanes to give **enantiomer 1** as an white solid. ¹HNMR (d-DMSO, 400 MHz) δ 8.33 (s, 1H), 8.13 (d, 1H), 8.01 (d, 1H), 7.82-7.65 (m, 6H), 7.48 (m, 2H), 7.30 (d, 1H), 6.48 (s, 1H), 4.16 (m, 1H), 4.02 (m, 1H), 3.27 (m, 1H), 3.18 (m, 1H), 1.69 (s, 3H).

Example 137

[0347] A mixture of **I-367** (5.87 g, ee >99.9%), EtOH (150 mL) and TsOH monohydrate (0.125 g) was refluxed overnight. The reaction mixture was concentrated to afford **enantiomer 2** as a white solid. ¹HNMR (d-DMSO, 400 MHz) δ 8.32 (s, 1H), 8.11 (s, 1H), 8.01 (d, 1H), 7.82-7.65 (m, 5H), 7.48 (m, 2H), 7.30 (d, 1H), 6.48 (s, 1H), 4.08 (m, 2H), 1.02 (m, 3H).

Example 138

[0348] To a solution of (+)-I-367 (1.1546 g, 2.58 mmol) in DMF (10 mL) at 0 °C was added K₂CO₃ (0.3597 g, 2.60 mmol), and then followed by ethyl bromoacetate (0.30 mL, 2.70 mmol). After stirring for 40 min at 0 °C, the reaction mixture was diluted with EtOAc and aq. NH₄Cl/H₂O. The organic layer was washed with aq. NH₄Cl/H₂O, and then brine/water, dried over Na₂SO₄, concentrated *in vacuo*. Purification *via* chromatography with EtOAc/hexanes (10% to 30%) to afford **enantiomer 3** (1.0211 g, 74%) as a white solid.

Chiral HPLC analysis of enantiomer was carried out at $\lambda = 220$ nm by injecting 10 μ L of an approximately a 0.5 mg/mL solution of the sample dissolved in mobile phase onto a 25 cm \times 4.6 mm Regis Technologies (R,R) Whelk-O 15 μ m column with a 1.5 mL/min flow of (3/97/0.1) *i*PrOH/hexanes/TFA. Under these conditions, **enantiomer 3** eluted at 12.3 min, and the corresponding pro-drug ester of **I-368** (- isomer) elutes at 13.1 min (approximate retention times). ¹H NMR (400 MHz, CDCl₃): δ 8.36 (1H, s), 8.26 (1H, d, *J* = 2.0 Hz), 7.98 (1H, d, *J* = 7.6 Hz), 7.81 (1H, m), 7.69 (1H, d, *J* = 7.2 Hz), 7.56 (2H, m), 7.46 (1H, m), 7.39 (2H, m), 7.12 (1H, d, *J* = 8.4 Hz), 5.98 (1H, s), 4.93 (1H, d, *J* = 15.6 Hz), 4.58 (1H, d, *J* = 15.6 Hz), 4.14 (2H, m), 1.67 (3H, t, *J* = 7.2 Hz) ppm.

In vivo Activities

15 [0615] The anti-diabetic activities of the compounds were evaluated in the C57BL/6j ob/ob Mice model.

A. Materials and methods

[0616] Male, 7-9 weeks old, C57BL/6J ob/ob mice were purchased from The Jackson Laboratory (Bar Harbor, ME, USA). Animals were housed (4-5 mice/cage) under standard
 20 laboratory conditions at $22 \pm 3^\circ\text{C}$ temperature and $50 \pm 20\%$ relative humidity, and were maintained on a diet of Purina rodent chow and water *ad libitum*. Prior to treatment, blood was collected from the tail vein of each animal. Mice that had non-fasting plasma glucose levels between 250 and 500 mg/dl were used. Each treatment group consisted of 8-10 mice that were distributed so that the mean glucose levels were equivalent in each group at the start
 25 of the study. Mice were dosed orally by gavage once a day for 1-4 days with vehicle and one or more dose of test compound at a dose ranging from 5 to 125 mg/kg. Compounds were delivered in a liquid formulation containing 5% (v/v) dimethyl sulfoxide (DMSO), 1% (v/v) Tween 80® and 0.9% (w/v) methylcellulose. The gavage volume was 10 ml/kg. Blood

samples were taken at 6 hours after the each dose and analyzed for plasma glucose. Food intake and body weight were measured daily. Plasma glucose concentrations were determined colorimetrically using a commercial glucose oxidase method (Sigma Chemical Co, St. Louis, MO, USA). Significant difference between groups (comparing drug-treated to vehicle-treated) was evaluated using the Student unpaired t-test.

B. Results

[0617] **Figure 6** illustrates the anti-diabetic effects of selected compounds of the present invention. **Table 15** provides the relative potency of some of these selected compounds.

Compounds that are effective for glucose lowering at the dose of ≥ 125 mg/kg are assigned a potency of +; compounds that are effective for glucose lowering at a dose of > 25 mg/kg but < 125 mg/kg are assigned a potency of ++; compounds that are effective for glucose lowering at a dose of ≤ 25 mg/kg are assigned a potency of +++. For example, a compound at 25 mg/kg that lowered the animal glucose level from 400 mg/dL (vehicle group value) to 250 mg/dL, is assigned the potency of +++.
